

CHAPTER-VI

SUPER KEYWORD:

- The super keyword is a reference variable that is used to refer to the immediate parent class object.
- Super keyword helps the child class access methods, variables and constructor of its parent class.

USES OF SUPER KEYWORD:

- Used to access parent class Variable.
- Used to call parent class Method.
- Used to call parent class Constructor.

ACCESS PARENT CLASS VARIABLE:

EXAMPLE:

```
class Animal{
    String name="Animal";
}
Class Dog extends Animal{
    String name="Dog";
    void show(){
        System.out.println("Name:" +super.name);
        System.out.println("Name:" +name);
    }
}
public class Example{
    public static void main(String [] args){
```

```
        Dog d = new Dog();
        d.show();
    }
}
```

CALL A PARENT CLASS METHOD:

EXAMPLE:

```
class Doc{
    void display() {
        System.out.println("The Doctor has 5 years of
experience");
    }
}

class Patient extends Doc{
    void display() {
        System.out.println("The patient was suffering from
cancer");
    }
    void show() {
        super.display();
        display();
    }
}

public class SupMedOverride {
    public static void main(String [] args) {
```

```
        Patient p = new Patient();
        p.show();
    }
}
```

CALL A PARENT CLASS CONSTRUCTOR:

EXAMPLE:

```
class Animal {
    String ani="Wild Animal";
    Animal(){
        System.out.println("The Type of Animal "+ani);
    }
}

class Lion extends Animal{
    String name="Lion";
    Lion(){
        super();
        System.out.println("The Wild Animal "+name);
    }
}

public class SuperKeyConst{
    public static void main(String [] args) {
        Lion l1 = new Lion();
    }
}
```

```
}
```

CALL A PARENT CLASS CONSTRUCTOR(PARAMETERIZED):

EXAMPLE:

```
class Breed {  
    Breed(String breed){  
        System.out.println("The breed of the dog");  
    }  
}  
  
class Name extends Breed{  
    Name(String breed, String name){  
        super(breed);  
        System.out.println("The breed"+breed);  
        System.out.println("The name of the dog"+name);  
    }  
}  
  
public class Dog{  
    public static void main(String [] args) {  
        Name n1= new Name("Bulldog","Pluto");  
    }  
}
```
