

CHAPTER – IX

LAMBDA FUNCTION :

- A lambda function (or lambda expression) is a short way to write anonymous methods (methods without a name).
- A lambda expression is a function written in a compact form.
- **SYNTAX:**

(parameter) -> { body }

EXAMPLE:

Say s = () -> System.out.println("Hello!!");

FILE HANDLING:

- File handling in Java allows programs to create, read, write, append, and delete files stored on disk.
- java.io package
 - File
 - FileReader, BufferedReader
 - FileWriter, BufferedWriter
 - FileInputStream, FileOutputStream

BUFFEREDWRITER:

- BufferedWriter writes text to a file faster by collecting data in a buffer before writing it all at once instead of writing character-by-character.
- **KEY FEATURES:**
 - Speeds up writing large text files

- Supports `newLine()` method to easily add new lines
- Works together with `FileWriter`, `FileOutputStream`, etc.

➤ **EXAMPLE:**

```
BufferedWriter bw = new BufferedWriter(new
FileWriter("sample.txt"));

bw.write("Hello World");

bw.close();
```

BUFFEREDREADER:

- `BufferedReader` is a class in Java used to read text from a file (or input source) efficiently by using a buffer (temporary memory area).

➤ **EXAMPLE:**

```
BufferedReader br = new BufferedReader(new
FileReader("sample.txt"));

String data = br.readLine();

System.out.println(data);

br.close();
```
